PATENT**IN THE UNITED STATES PATENT AND TRADEMARK OFFICE**

Applicant:	Burne et al.	Examiner:	Padmanabhan
Serial No.:	09/582524	Group Art Unit:	1641
Filed:	June 27, 2000	Docket No.:	7500.392USWO
Title:	ASSAYS FOR AUTOANTIBODIES		

DECLARATION OF BERNARD REES SMITH
UNDER 37 C.F.R. §1.132

Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

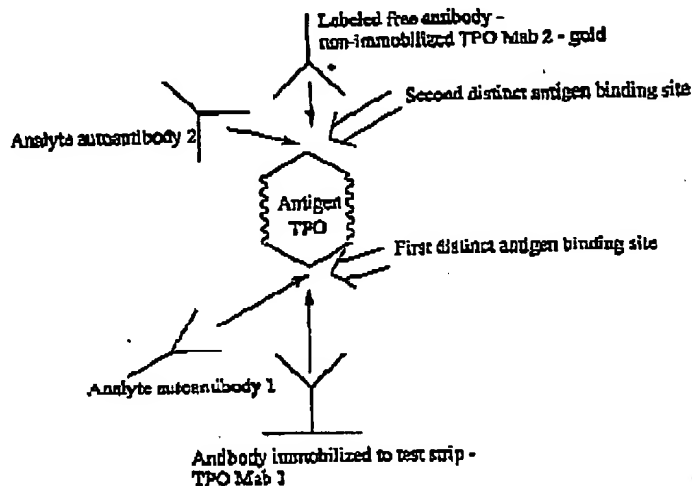

Dear Sir:

I, Bernard Rees Smith, residing at Richmond House, Druidstone Road, Old St Mellons, Cardiff, CF3 6XD, a citizen of the United Kingdom, hereby declare:

1. I am one of the inventors of Application Serial No. 09/582524 filed on June 27, 2000 with the United States Patent and Trademark Office.
2. I am presently the Managing Director of RSR Limited and have held that position since 1982. I have extensive knowledge in the field of immunology and attach a copy of my Curriculum Vitae as Exhibit A, which shows my experience as a scientist from 1965 to date, especially in the area of the present invention.
3. I have read the Office Action mailed August 26, 2003 concerning this application.
4. I assert the assay of the invention, covered by claims 168 and 198 provides surprisingly better results than that of the prior art. The following example tested the same samples using (a) an assay according to the invention as covered by claims 168 and 198 where a double perturbation of binding is seen further to the presence analyte autoantibodies 1 and 2, and (b) an assay where a single perturbation of binding is seen, which single perturbation of binding can be correlated with the single perturbation of binding associated with the prior art assays of Bergman (US 5501955). Assay (a) can be represented by the following diagram and represents

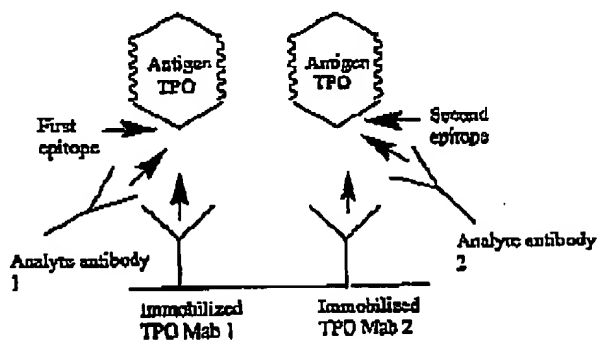

the subject matter of claims 168 and 198, wherein as indicated above a double perturbation of binding is seen further to the presence analyte autoantibodies 1 and 2:

Assay a

Assay (b) represents an assay where a single perturbation of binding is seen, which single perturbation of binding can be correlated with the single perturbation of binding associated with the prior art assays of Bergman:

Assay b

It can be appreciated from the above that in both assays (a) and (b) the same autoantibody-antigen, and Mab-antigen, interactions are being observed. However, assay (a) is such that the interactions are incorporated into a single assay binding system on the strip.

whereas in assay (b), two assay systems on the test strip are employed. Most importantly, for (a) this results in a double perturbation in binding of antigen TPO to the strip by virtue of analyte autoantibodies 1 and 2 respectively interacting with the above illustrated first and second binding sites of antigen TPO, whereas for (b) a single perturbation in binding of antigen TPO to the strip is respectively seen at immobilized TPO Mab 1 and immobilized TPO Mab 2 by virtue of analyte autoantibodies 1 and 2.

Table 1 provides the results from the two assays.

Table 1

Test sample NIBSC 66/387 diluted in whole blood	Results with assay	
	(a)	(b)
U/mL		
0	-	-
3	-	-
10	+	-
20	+	-
30	+	+
50	+	+

- (a): Assay with TPO Mab 1 immobilized on the strip, non-immobilized TPO Mab 2—gold (label) and non-immobilized TPO. TPO Mab 1 and TPO Mab 2 interact with distinct autoantigenic epitopes on TPO;
- (b): Assay with TPO Mab 1 immobilized on the strip, TPO Mab 2 immobilized on the strip and non-immobilized TPO—gold (label).

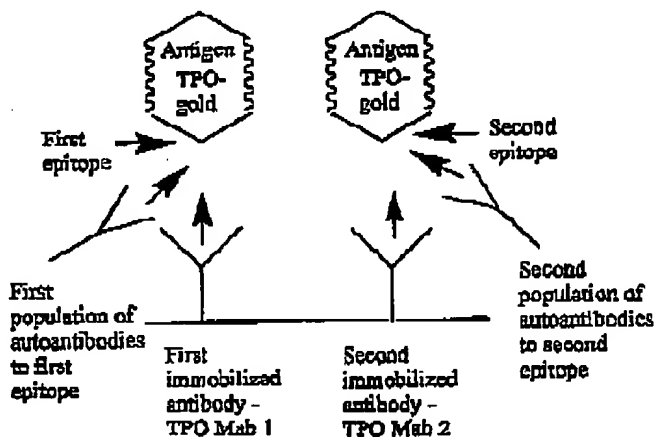

The above described double perturbation of autoantibody binding that is seen with assay (a) is of particular significance in that sensitivity of autoantibody detection in a patient sample is improved. This can be seen by reference to the results given in Table 1, where for assay (a) 10 U/mL of test sample NIBSC 66/387 can be detected, whereas for assay (b) it is only possible to detect 30 U/mL of test sample NIBSC 66/387. This improved level of autoantibody detection can be important where lower levels of autoantibody may be present in a patient sample for detection, and where such autoantibodies although present at low concentrations are indicative of autoimmune disease.

For the prior art test tube incubation techniques described by Bergman, as previously advised Bergman does not allow for autoantibody detection by synchronous competitive

inhibition of antibody binding at first and second sites on the antigen. Therefore, an assay of the invention, assay (a), provides a rapid assay for use at the point of patient care (avoiding the hitherto need to take blood samples from a patient for remote laboratory analysis, which has proven costly both in terms of time and laboratory personnel). As explained above, this can now enable detection of lower levels of autoantibody present in a patient sample and thus provide a reliable diagnosis of autoimmune disease.

The Examiner should appreciate from the above that a significant clinical advance is achieved by this invention, enabling autoantibody detection to be carried out at the point of patient care and with improved sensitivity levels.

5. I also believe that an assay, as represented by claims 184 and 211 provides significant, and unexpected advantages over the prior art. The following example provides results from an assay, as represented by claims 184 and 211. The assay can be represented by the following diagram.

This assay employs first and second immobilized antibodies allowing the detection of distinct autoantibody populations on a test strip. Looking at the test tube incubation assays of Bergman, the idea of detecting first and second analytes would have been meaningless in the context of the test tube conditions employed, given the inability to detect and distinguish between different analytes under such conditions. This assay is, therefore, clearly advantageous in allowing first and second autoantibody populations to be distinguished and detected, whereby

the test strip allows first and second detection zones to be monitored by virtue of immobilized TPO Mab 1 and TPO Mab 2 respectively provided at discrete locations on the test strip.

The results can be seen in Table 2 below.

Table 2

Patient Sample Code	Serum TPOAb level by RIA (U/mL NIBSC 66/387)	Results using immunochromatographic strip containing TPO Mab 1 and TPO Mab 2 immobilized on the strip in different positions. Inhibition of TPO-gold binding to:-	
		Mab 1	Mab 2
A	80	-	+
B	1240	-	+
C	95	-	+
D	1265	-	+
E	23	+weak	+strong
F	135	-	+
G	140	-	+
H	140	-	+
I	55	-	+
J	220	-	+
K	55	+	+
L	65	+	+
M	260	+	+
N	1025	+	+
O	22	+	-
P	44	+	-
Q	258	+	-
R	66	+	-

The above detection and identification of first and second autoantibody populations can be of particular significance given that a heterogeneous autoantibody population of different compositions is generally formed in autoimmune disease. In this way, by detecting autoantibodies to more than one epitope as achieved by the assay of the invention, wherein at least first and second autoantibody populations can be detected and identified, this would enable a more reliable diagnosis of autoimmune disease to be achieved. For example, in prior art assays where only one autoantibody population to a single epitope region was detected, autoantibodies to a different epitope could remain undetected despite being indicative of autoimmune disease and as such misdiagnosis as to the presence of autoimmune disease could occur. Given the

above complexity of the autoimmune response and clearly the heterogeneous nature of the autoantibody population which can recognize different epitopes, it is desirable and indeed often necessary that more than one autoantibody population can be detected and reliably identified in a test assay.

6. I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

Date: 20th February 2004

PATENT INQUIRY OFFICE

CURRICULUM VITAE

BERNARD REES SMITH

Bernard Rees Smith**UNIVERSITY EDUCATION:**

B.Sc. Department of Chemistry, University of Sheffield 1965

Higher Degrees:

Ph.D. Department of Pharmacology, University of Sheffield 1968

D.Sc. Faculty of Science, University of Sheffield 1986

Special Awards:

Harington De Visscher prize of the European Thyroid Association (in recognition of outstanding contributions to thyroid research) 1984

Honorary member of the Japan Endocrine Society 1992

RSR Ltd. received Queen's Awards for Export Achievement 1987, 1991 and 1995

Lissitzky Career Award of the European Thyroid Association in recognition of life-long contribution to thyroid research 1999.

PREVIOUS APPOINTMENTS:

1970-1972 Medical Research Council of Canada Post-Doctoral Fellow in the Department of Biochemistry, University of Toronto

1972-1976 Lecturer in the Departments of Medicine and Clinical Biochemistry, University of Newcastle upon Tyne

1976-1980 Wellcome Senior Lecturer in the Departments of Medicine and Clinical Biochemistry, University of Newcastle upon Tyne

1980-1982 Senior Lecturer, Department of Medicine, University of Wales College of Medicine, Cardiff

1982-1995 Reader in Endocrine Immunology, University of Wales College of Medicine

PRESENT APPOINTMENTS:

Honorary Senior Lecturer, University of Wales College of Medicine (from 1995)

Managing Director, RSR Ltd., Avenue Park, Pentwyn, Cardiff, CF23 8HE (from 1982)

SUMMARY OF MAJOR RESEARCH CONTRIBUTIONS

Structural analysis of long-acting thyroid stimulator and characterisation of its receptor in the thyroid.

Analysis of inter-domain interactions in immunoglobulin G.

Demonstration that Graves' IgG contains antibodies which interact directly with the thyrotrophin (TSH) receptor and that these antibodies are responsible for Graves' hyperthyroidism.

Development of radioreceptor assays for TSH receptor antibodies.

Analysis of the role of TSH receptor antibodies in controlling thyroid function in ophthalmic Graves' disease

Development of techniques to study TSH receptor antibody, thyroglobulin antibody and microsomal antibody production in culture and application of these techniques to investigate factors which control thyroid autoantibody synthesis.

Demonstration that the various forms of treatment for Graves' disease have marked effects on TSH receptor antibody synthesis and that these effects are related to the outcome of therapy.

Determination of the structure of thyroid microsomal antigen/thyroid peroxidase.

Purification of the TSH receptor by affinity chromatography and characterisation using photoaffinity labelling.

Demonstration that a water soluble fragment of the TSH receptor contains binding sites for both TSH and TSH receptor antibodies.

Determination of the structure, molecular size and shape of the TSH receptor.

Production of the first human monoclonal thyroglobulin autoantibodies.

Production of the first human monoclonal TPO autoantibodies.

First successful application of the combinatorial repertoire approach to the production of recombinant human thyroid autoantibodies.

Demonstration that 21-hydroxylase is a major adrenal autoantigen and development of assays for 21-OH autoantibodies.

Determination of the variable region sequences of monoclonal and recombinant human thyroid autoantibodies and assessment of the relationship between sequence and epitope specificity.

Demonstration that autoantibodies to 17 α -hydroxylase and to cytochrome p450_{sc} are the 2 components of steroid producing cell autoantibodies.

Development of the first RIA for TSH receptor autoantibodies.

Development of the first sensitive and specific non-isotopic assays for autoantibodies to GAD and to IA2.

GRANTS AND AWARDS FOR RESEARCH

- 1973 and 1974 £9,133 from the Medical Research Council and £700 from the Ernest and Minnie Dawson Cancer Trust to support studies on the characterisation of the thyroid cell surface.
- 1975 £12,000 from the Medical Research Council in the form of a training fellowship for Dr. T. F. Davies to study thyroid-stimulating antibodies in Graves' disease.
- £13,477 from the Medical Research Council to support studies on the synthesis of thyroid-stimulating antibodies (with Professor R. Hall).
- 1977 £21,077 from the Wellcome Trust to support studies on an experimental model for Graves' disease (with Professor Hall).
- £18,337 from the Medical Research Council for a project entitled "Purification and characterisation of thyroid-stimulating antibodies" (with Professor R. Hall).
- £20,600 from the Cancer Campaign for the study of serum thyroid-stimulating antibodies, thyroglobulin and the thyroid cell in patients with thyroid cancer (with Mr. W. M. Ross and Professor R. Hall).
- £11,943 from the Research Committee of the Newcastle Area Health Authority (Teaching) to support an investigation into structure-activity relationships in thyrotrophin and thyroid-stimulating antibodies.
- 1978 £5,957 from the Research Committee of Newcastle Area Health Authority (Teaching) for a study of the TSH receptor at the ultrastructural level.
- £15,000 from the Medical Research Council in the form of a training fellowship for Dr. A. M. McGregor to study lymphocyte function in autoimmune thyroid disease
- 1980 £32,515 from the Medical Research Council for a project entitled "the relationship between receptors for long-acting thyroid-stimulator and thyrotrophin" (with Professor R. Hall).
- £20,000 from the Medical Research Council in the form of a training fellowship for Dr. A. P. Weetman to study autoantibody synthesis *in vitro*.
- £16,097 from the Welsh Office scheme for the development of health and social research to support an investigation into prediction of relapse in Graves' disease

- 1981 £3,565 from the Sir Stewart Halley trust to study the influence of antithyroid drugs and sex hormones on thyroid autoantibody synthesis in Graves' disease (with Dr. A. P. Weetman and Professor R. Hall).
- £90,000 from the Wellcome Trust in the form of a Wellcome Senior Research Fellowship for Dr. A. M. McGregor to study the production and properties of monoclonal human thyroid autoantibodies (with Professor R. Hall).
- 1982 £26,000 from the Welsh Office to investigate the properties of TSH receptor binding and thyroid stimulating antibodies in Graves' disease.
- 1983 £48,000 from the Medical Research Council to support an investigation into phoraffinity labelling of the thyrotropin receptor.
- 1984 £44,000 from the Medical Research Council to support an investigation into a water soluble fragment of the TSH receptor.
- 1990 £73,000 from the Medical Research Council to support an investigation of autoimmune thyroid disease at the molecular level in collaboration with the University of Sheffield (with Professor D. R. Burton).
- 1991 £116,838 from the Science and Engineering Research Council to meet half the costs (the remaining funding to be made by RSR Ltd., Cardiff) of a 3-year project in collaboration with the University of Bath to produce recombinant TSH receptor. The project to be administered by the Teaching Company.
- 1994 from the Science and Engineering Research Council for a CASE research studentship in collaboration with the University of Sheffield to work on the analysis of human autoantibodies in thyroid disease.
- 1997 from the Medical Research Council for a 3-year industrial collaborative studentship (with the Universities of Bath and St. Andrews) to work on the crystallisation of thyroid peroxidase.

RESEARCH FUNDING AND RSR LTD.

RSR Ltd. was formed in 1982 with the aim of providing funds for academic research from the manufacture and sale of reagents for diagnostic kits. At first, the Company operated in the Department of Medicine, University of Wales College of Medicine and paid the College a percentage of sales. In 1985, RSR's manufacturing operations moved to a purpose-built site at Penrwyn Cardiff and in 1994, construction and operation of a basic research facility at Llanishan Cardiff was completed. RSR provided most of the funds for running the Endocrine Immunology Unit in the Department of Medicine, University of Wales College of Medicine between 1985 and 1994.

OUL STATION

PAPERS PRESENTED TO LEARNED SOCIETIES (CONT.)

TSH receptor: structure and function
Inaugural meeting of the Belgian Contact group on signal molecules and their receptors
Antwerp 1987

TSH receptor subunit structure
Symposium lecture at the European Congress of Endocrinology Copenhagen 1987

Thyroid Autoantigens
Introductory lecture to the European Thyroid Association meeting Lausanne 1987

The structure of the TSH receptor
First David Owen Segal thyroid lecture Mount Sinai School of Medicine, New York 1987

Lecture tour of Japan - lectures at Universities of Sapporo, Tokyo, Maebashi, Nagoya and
Kyoto followed by a plenary lecture entitled "Autoantibodies to the TSH receptor" at the 8th
International meeting of the Japanese Endocrine Society, Lake Biwa 1987

TSH receptor antibodies
Symposium on thyroid autoimmunity, pathophysiology and diagnosis Brussels 1988

The TSH receptor
Symposium lecture at the 8th International Congress of Endocrinology Kyoto Japan 1988

TSH receptor structure (invited lecture)
Direct supersensitive assays for thyroid autoantibodies
Relationship between thyroid autoantibody spectrotypic and IgG subclass
All presented to the Fourth Asia and Oceania Thyroid Association meeting Seoul Korea 1989

Structural analysis of the TSH receptor
International meeting on physiological regulation and biological function of thyrotropin Goslar
1989

Autoantibodies to thyroid peroxidase and thyroglobulin are inherited as an autosomal dominant
characteristic in families not selected for autoimmune thyroid disease
B and T cell epitopes on thyroid peroxidase
International meeting on TPO and thyroid autoimmunity Marseille 1990

Thyroid stimulating hormone/receptor interactions
British Endocrine Societies symposium Brighton 1991

Introductory review for the session on Autoimmunity at the 19th meeting of the European
Thyroid Association held in Hannover, Germany, 1991.

Structure and Function of the TSH receptor
International satellite meeting on thyrotropin receptor antibodies, Kyoto Japan December 1992

Structure and characteristics of autoantibodies to thyroid peroxidase and to thyroglobulin
International Hashimoto symposium Fukuoka Japan December 1992

23/02 '04 15:29 FAX 01792 458244

UDL SWANSEA

PAPERS PRESENTED TO LEARNED SOCIETIES (CONT.)**TSH receptor antibodies**

Lecture at University of Seoul Korea December 1992

Thyroid autoantibodies - new methods of analysis
Lecture at Tohoku University Japan 1992**Modern aspects of Graves' disease treatment**
6th Latin American Thyroid Congress Buenos Aires Argentina May 1993**Thyroid autoantigens - Dr. Roberto Soto Memorial Lecture, 6th Latin American Thyroid Congress Buenos Aires Argentina May 1993****Thyroid autoantibodies - an overview**
Lecture at University of Osaka, Japan March 1994**Detection and measurement of thyroid autoantibodies**
Conference on the clinical evaluation of Tg autoantibodies and TPO autoantibodies, Tokyo Japan March 1994**Thyroid Autoimmunity 1994**
Lecture at the University of Kyoto Japan March, 1994**Chairman of session on TSH receptor**
American Thyroid Association, September, 1994**Endocrine Autoimmune Diseases - Recent progress and Future developments**
Invited speaker - Cosmic Endocrine Forum - 68th Japan Endocrine Meeting 1995**Lectures at Gunma University Medical School, Tokyo Women's Medical College, Shinshu University Medical School and SRL Japan June 1995****Welsh Association of Clinical Biochemists Llandrindod Wells 1997****TSH receptor antibody measurements by ELISA. 72nd annual meeting of the American Thyroid Association 1999.****TSH receptor autoantibodies. Invited speaker. 12th International Thyroid Congress Kyoto 2000.****TSH receptor autoantibodies - invited speaker, University of Poznan. 2000****TSH receptor autoantibodies. Invited speaker, University of Padua special seminar. 2000****The TSH binding pocket. British Thyroid Association. 2001**
